(57) Abstract:

PROBLEM TO BE SOLVED: To enable bidirectional audio communication with a telephone terminal connected to a general telephone network on a client terminal connected to the internet.

SOLUTION: A client terminal 110 has an internet telephone software 112, and a WWW server 120 has data including the application name of the internet telephone software 112 and a telephone number as data linked to the telephone number described in home page data. When a user designates the telephone number of a home page displayed on a Web browser 111 at the client terminal 110, the WWW server 120 sends the data including the application name and the telephone number to the client terminal 110. The client terminal 110 automatically activates the internet telephone software 112 of the application name described in the data and while using the telephone number in the data, the internet telephone software 112 establishes the audio communication with the relevant telephone terminal.
